

Triage Verdict

Seven parts, one paragraph of thinking. Test: could another analyst retrace your steps from this page alone?

ALERT ID	SOURCE SYSTEM	ALERT TIME (UTC)	ANALYST
CLD-0102	Defender AV (endpoint)	02:13 – 02:41 UTC, 1 Sep 2025	Adithyan V

ALERT (WHAT FIRED, ON WHOM OR WHAT)

Trojan:Win32/Stealgen.B on LDN-WS-117 (liam.doyle), 4 detections, quarantine failed each time.

HYPOTHESIS (BOTH DIRECTIONS)

Malicious: live infection actively resisting removal. Benign: false or stale detection on an already-clean host.

EVIDENCE CHECKED (NAME THE ACTUAL SOURCES AND WHAT EACH SHOWED)

AV log: scheduled scan clean on 30 Aug; four detections on 1 Sep with escalating failure reasons (file in use, access denied, file recreated) and a second dropped file wsync_upd.exe at 02:41 in the same AppData folder. Handover: no change or deployment explains it. Sign-in slice: no anomalous sign-ins for liam.doyle yet (normal 08:05 logon).

SEVERITY YOU ASSIGNED (TICK ONE)

☐ Sev 1 ☒ Sev 2 ☐ Sev 3 ☐ Sev 4 ☐ Informational

REPORTED SEVERITY, AND WHY RE-RATED

Reported High; held at Sev 2 on blast radius.

ACTION (CLOSE / MONITOR UNTIL / ESCALATE TO / GATHER WHAT)

Isolate LDN-WS-117 via endpoint management; raise an eradication and reimage incident with IT; precautionary password reset and session revocation for liam.doyle; monitor the account for anomalous sign-ins over the next 72 hours.

JUSTIFICATION (THE SENTENCE THAT MAKES IT DEFENSIBLE)

A false detection does not fail quarantine three different ways and then recreate itself under a new name; regeneration confirms execution. The clean scan two days prior brackets the infection window.

MITRE ATT&CK; (TRUE POSITIVES AND ESCALATIONS ONLY; A FALSE POSITIVE GETS NO TECHNIQUE)

ALERT ID
CLD-0109

SOURCE SYSTEM
Network / Proxy telemetry

ALERT TIME (UTC)
07:40 UTC onward, 1 Sep
2025

ANALYST
Adithyan V

ALERT (WHAT FIRED, ON WHOM OR WHAT)

Three hosts beaconing every 60 seconds to 198.18.207.66, resolving to a domain registered 9 days ago; traffic ongoing since 07:40.

HYPOTHESIS (BOTH DIRECTIONS)

Malicious: active C2 channel spanning multiple hosts from a common compromise. Benign: legitimate vendor or update-check traffic on a freshly provisioned service domain.

EVIDENCE CHECKED (NAME THE ACTUAL SOURCES AND WHAT EACH SHOWED)

Proxy log: fixed 60-second beacon interval across all three hosts, consistent with automated check-in rather than user browsing. WHOIS: destination domain registered 9 days ago, no established reputation. Allow-list review: neither the IP nor the domain appears on the approved vendor list. Timeline: all three hosts began beaconing at the same 07:40 start time, pointing to a shared infection event rather than independent, unrelated causes.

SEVERITY YOU ASSIGNED (TICK ONE)

☒ Sev 1 ☐ Sev 2 ☐ Sev 3 ☐ Sev 4 ☐ Informational

REPORTED SEVERITY, AND WHY RE-RATED

Reported Critical; held at Sev 1 — multiple hosts, live outbound C2.

ACTION (CLOSE / MONITOR UNTIL / ESCALATE TO / GATHER WHAT)

Block the IP and domain at firewall/proxy immediately; isolate all three affected hosts from the network; open an endpoint forensics task to identify the initial infection vector; hunt environment-wide for the same IOC on other hosts.

JUSTIFICATION (THE SENTENCE THAT MAKES IT DEFENSIBLE)

A domain registered nine days ago does not organically receive fixed-interval, simultaneous traffic from three separate hosts; the beacon regularity and shared start time together indicate coordinated C2 infrastructure, not incidental third-party traffic.

MITRE ATT&CK; (TRUE POSITIVES AND ESCALATIONS ONLY; A FALSE POSITIVE GETS NO TECHNIQUE)
